JIGSAW PUZZLE

CUSTOMIZE AND CREATE

Puzzle Restrictions:

Currently, there is no limit on max puzzle size. But it is better to keep both column and row values below 100.

Individual puzzle pieces can be grouped into clusters, and both clusters and individual pieces can be snapped to the puzzle board.

Available Settings:

If the "**Rotate Pieces**" option is checked in settings, this will allow pieces to be rotated when they are on a game board. This will also make all pieces under the "Pieces Panel" randomly rotated when the puzzle is loaded/started.

If the "**Free Snap**" option is selected, it will allow both puzzle pieces and puzzle clusters to be snapped to the puzzle board without having a neighbor snapped. This makes the game a lot easier. Without this option enabled player will have to start from the puzzle border, and will only be able to attach puzzle pieces to other already snapped pieces.

If the "**Shuffle Pieces**" option is checked, it will reshuffle all pieces in the pieces panel every time puzzle is started/loaded.

Save/Load system:

The app has a puzzle save/load system implemented. Puzzles are saved when the app is either paused, or closed, or when a user exits to the main menu.

Puzzles are identified by 2 id fields. One is taken from the **Puzzle Info Object** and the other is from the **"Puzzle Settings Object"** when the puzzle is created. Check **"PuzzleFactory.FromEdgePresets"** method for details.

All save files are stored locally in the application's persistent data path, under the "SavedGames" folder.

Saved games can be continued from the Home menu "Continue Playing" section, or when opening a puzzle from the categories tab, that already has a saved file.

Players will be presented with an option to load previously abandoned game or start from scratch.

Puzzle Textures information:

For puzzles with big dimensions, i.e. 20*20 and more, it is better to use at least 1024*1024 textures.

Best results are achieved with 2048*2048 textures. They generally don't take too long for the Puzzle component to generate puzzle texture, and allow for a high level of fidelity for each puzzle piece.

Also, try to use textures that are multiples of 2. This will enable a compression option within Unity "Texture Import Settings", which helps save space for a final app build.

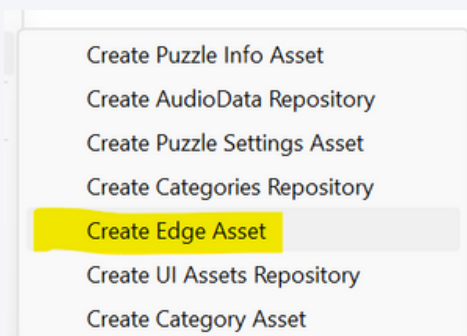

It is not advised to use textures bigger than 2048*2048; textures up to 4096*4096 are also supported.

Use textures in the project "Textures" folder as guidelines for what settings to use.

Creating Puzzle Hooks (Edges):

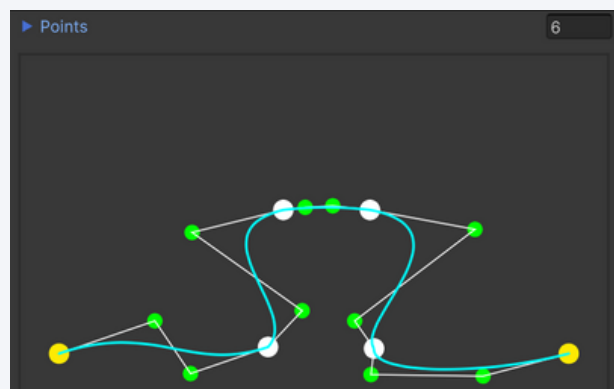

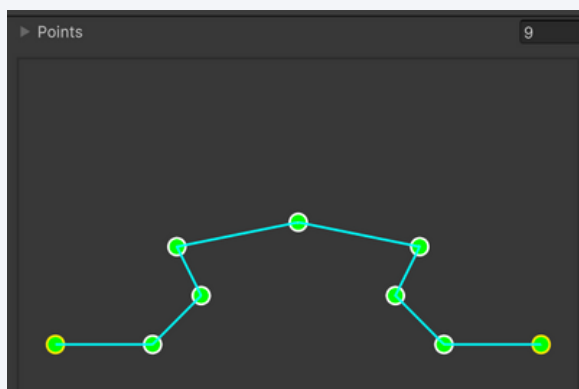

To create new puzzle hook, right-click in project view, and click at "Create/JigsawPuzzle/Create Edge Asset" option.

Doing so will create new EdgeAsset. Feel free to modify it by adding/moving points around to define edge option for your future puzzles.

NOTE: Just make sure that edge lines do not overlap with other "Edge Assets" lines when combining them inside "Puzzle Settings".

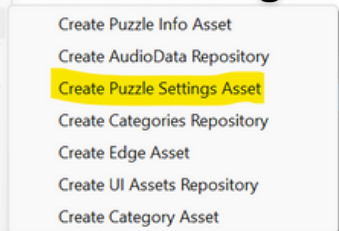

Edge Assets Examples:

JIGSAW PUZZLE CUSTOMIZE AND CREATE

Creating "Puzzle Settings":

Puzzle options allow you to combine different EdgeAsset files to customize your own puzzle set-up. Right-click in project view, and click at "Create/JigsawPuzzle/Create Puzzle Settings Assets" option to create one.

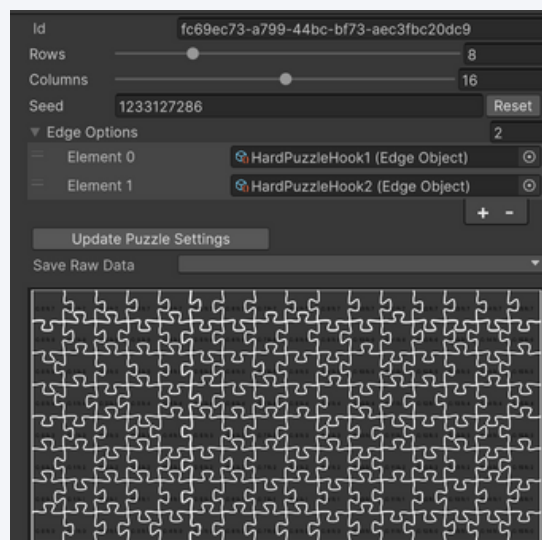

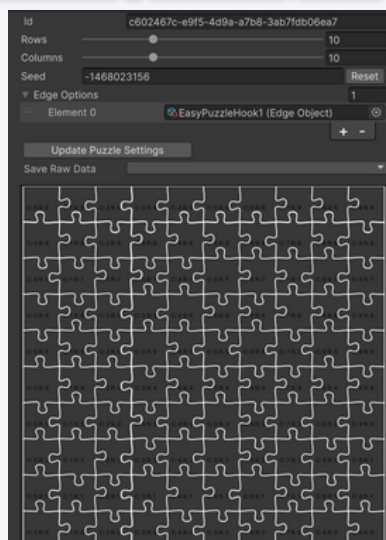

Use different combinations of "Edge Option" field to customize what puzzle pieces can look like. Each entry in "Edge Option" field are a separate "EdgeAsset".

Modify "Columns" and "Rows" fields to specify puzzle settings dimentions.

NOTE: Seed field is editor only and serves as a reference to what seed value to use to get same looking puzzle when creating one.

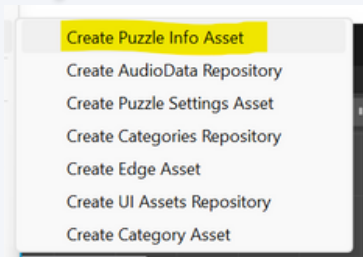

Puzzle Settings Examples:

Creating "Puzzle Info Objects":

Puzzle Info Objects let you combine different "Puzzle Settings" with a Texture that are used by Puzzle component to generate the actual puzzle to play. Right-click in project view, and click at "Create/ JigsawPuzzle/ Create Puzzle Info Assets" option to create puzzle info object.

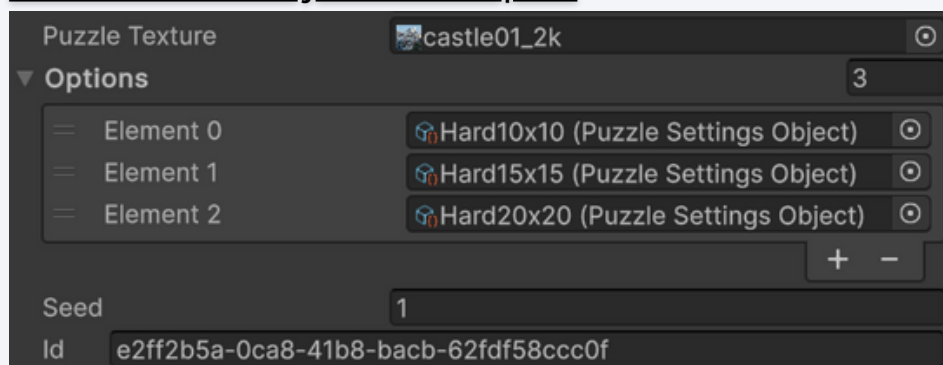

Puzzle Info have a field for **Texture** that is to be used for the puzzle, and a list of "**Options**", for all puzzle settings available with this puzzle info object.

Seed field allows to generate same puzzle every time this puzzle started/loaded.

Id adds a support for save/load functionality.

Creating "Categories":

Categories are simply a set of "Puzzle Info Objects" that allows players to choose a category to pick a puzzle from. Create one by choosing "JigsawPuzzle/Create Category Asset" option from "Create" menu.

After putting your "Puzzle Info Objects" into a category, it can be added to "Categories Repository" asset to be available during gameplay. "Categories Repository" can be found under "JigsawPuzzle/ScriptableObjects/Repositories" folder. Alternatively you can create a new "Categories Repository" using "Create" menu "JigsawPuzzle/Create Categories Repository" option.

NOTE: If custom "Categories Repository" is used, don't forget to assign it to "Categories Repository" field on "Data Handler" object in a scene hierarchy.

Category Asset Example:
